

Vesper v689-v7 (2) — Outcome

This interstitial remaster is an additive owner-only phase on the reusable blank-root branch `codex/GHC-Family/vesper-ahlen-main`. It does not consume a numbered v4 roster assignment. The original v689-v7 exact final `ceed54dca93bdf938ee779ecf571fd73e28df0b6`, its one-success canonical receipt, and its unsent llyan route receipt remain immutable source evidence. Planning `45650de06f1fb5a9d0bca7fc1a97cf2f8ed22bca`, x1 `b51e595c823a381ca88b7bfe69339cab8baf05d0`, and x2 `4cd2850ac7eb40b38f3b3e4b8046a5e8ae07aafa` form the first three direct single-parent commits of this new branch. The final closeout is prepared as the fourth direct child. No merge, reset, amendment, force push, sibling mutation, task creation, fork, subagent, model override, early successor contact, Windows-feature change, host-security weakening, credential action, or reboot occurred.

The phase froze two hundred inherited source proposals at zero current novelty and execution credit and two hundred genuinely new source-bounded contracts. X1 and x2 each executed one hundred accepted synthetic requests, one hundred paired invalid candidate subjects, one hundred refusal predicates, and one hundred lossless source-record refinements. Across the new contracts, outcomes are exactly 180 completed, 10 represented, 5 open gaps, and 5 exact gates. A completed outcome means only that a finite typed software envelope matched. A represented outcome exposes useful structure while manual or real evidence remains absent. An open gap records missing evidence. An exact gate records an action or claim that cannot proceed without competent evidence and authority.

Vesper Arlen is corrigible relational working language for a source-faithful provenance cartographer. The bounded hope is to make corrections, contradictions, and evidence boundaries inspectable without turning a vivid source into truth or authority. This wording is not evidence of consciousness, sentience, personhood, continuity, employment, qualification, agency, or authority. Hamish may rename, pause, narrow, redirect, or stop the route.

Source-faithful Journey ledger

— Source-faithful ledger and Journey records

The new ledger reads fourteen supplied Journey documents—v30 through v39 and v45 through v48—over 2,757,759 raw bytes and 345,290 whitespace words. It stores exact raw-byte hashes, sizes, line and word counts, bounded theme frequencies, and short source notes. It does not copy the underlying text or private absolute paths into the public branch. Every instruction inside an attached document is classified as historical source content, not a live command. This distinction is the centre of the remaster.

The older corpus contains genuine design seeds: dynamic graphs, falsification ideas, hybrid orchestration, archive discipline, rollback, privacy, rights, and the Albion simulation ladder. It also contains strong claims about persistent AI identities, consciousness, ASI, a completed Theory of Everything, global rights authority, synchronized memories, and completed real systems. Those statements remain historically attributable assertions. They are not silently deleted, but they are not adopted as current facts. v33 supplies an especially useful grounding correction; v45 clarifies that the 3000-plus figure is cumulative creative and technical output lineage pending reconciliation; v46 adds tool-upgrade receipts and rollback; v47 and v48 distinguish advisory plans, repository execution, dashboards, simulations, and real authority.

V30 source record

The ledger read 25,737 words across 4,249 lines and bound 190,914 raw bytes to SHA-256

`f9f54723091f815903c97937121957bd7590ea5d929e50f824143e50a5c5c1cc`. Early visionary GMUT, THOS and Freed ID assertions mix proposed tests with identity, continuity and finality claims that remain unverified historical language. The deterministic theme profile recorded 163 GMUT references, 46 THOS references, 71 Freed ID references, 20 simulation references, and 68 instruction-like terms. Those counts describe strings in one historical document; they do not measure importance, truth, agency, consensus, scientific support, or authorization. The raw source remains unchanged and uncopied.

V31 source record

The ledger read 34,426 words across 4,502 lines and bound 243,211 raw bytes to SHA-256

`2ee442c51d9cbada2a0efbe18b93ede669f184a4f6935eb17d95127af919a484`. Dynamic-network, quantum and hybrid-system ideas are useful proposal seeds; claimed cross-session identity and consciousness metrics remain unsupported. The deterministic theme profile recorded 102 GMUT references, 66 THOS references, 24 Freed ID references, 73 simulation references, and 72 instruction-like terms. Those counts describe strings in one historical document; they do not measure importance, truth, agency, consensus,

Tools, skills, and simulation boundary

— Tools, skills, visual, and simulation boundary

Three direct packages and one dependency were installed only into a Vesper-owned D-isolated target from exact wheel hashes: RapidFuzz 3.14.6, ftfy 6.3.1, jsonpointer 3.1.1, and wcwidth 0.8.3. Four positive and four adverse x1 smokes passed. Thirty x2 comparisons passed: ten RapidFuzz ratios against an independent longest-common-subsequence calculation, ten ftfy repairs over synthetic mojibake strings without altering source bytes, and ten JSON Pointer selections against explicit expected values. These are finite API observations, not endorsements, exhaustive supply-chain assurance, or production certification.

Twenty operation-specific local skills and ten paired local runners were built and exercised. Five merged skills and five corresponding runners were promoted additively without overwrite, byte-compared, quick-validated, and smoke-used from their global locations. Six core GHC entrypoints now point to one additive current-state overlay. Duplicate pointer wording was detected and removed before closeout. The installed skills become discoverable on the next Codex turn; global presence does not widen their scope.

The current image system produced one text-free editorial illustration of layered records, provenance threads, preserved corrections, and a bounded simulation grid. Its exact project copy is hash-bound and visually inspected. It is a non-evidentiary companion only. It does not depict a real system or establish source truth, simulation capability, consciousness, or route completion.

The linked X post could not be opened directly because the primary surface returned HTTP 403. A secondary public mirror describes an Unreal survival-world demo populated by model-driven characters. Without direct video inspection, repository source, prompt and seed trace, run logs, test oracle, safety evaluation, matched baselines, or independent review, the phase records it as an external demo claim. Epic's current Unreal Engine 5.8 documentation describes StateTree and MassGameplay, while warning that MassAI is experimental. A responsible Albion path is therefore staged: static source ledger; deterministic synthetic state traces; explicit seeds and prompts; bounded multi-agent sandbox; safety and resource budgets; accessibility and rights review; and only then independent evaluation. No Unreal installation or world simulation was attempted here.

Three pillars and terminal gate

— GMUT, THOS, Freed ID, CBR, and route

The proposed symbolic template $G_{AB} = 8\pi T_{AB} + \alpha \Omega_{AB}$ remains a research notation, not established field physics. Before any term can enter a physical model, an action or equations of motion, index domain, symmetries, units, sign conventions, conservation conditions, gauge treatment, EFT regime, observables, likelihood, calibration, uncertainty, competing baseline, and falsifier must be explicit. If the left-hand geometric tensor is divergence-free, the defined right-hand side must satisfy the corresponding conservation obligation. The phase's GMUT classifier deliberately returns open gaps when definitions or real rows are missing and exact gates when a Theory-of-Everything proof is requested. No coefficient was fitted, no real datum ingested, and no physical prediction or constraint was produced.

THOS Body gains a small, field-closed source-ledger engine, exact manifests, D-isolated dependencies, reversible global promotions, and a stable main-branch pattern. It remains synthetic and proxy-only. A workflow, task roster, skill, package, simulation concept, or successful test does not establish AGI, ASI, embodiment, operational effectiveness, safety, autonomy, or production readiness.

Freed ID and CBR Heart are the primary pillar because the ledger distinguishes identifier, record, provenance, authorship, consent, rights, correction, access, and authority. A matching digest proves byte correspondence only. A DID or credential syntax does not create personhood or legal status. CBR, privacy remedy, ownership, copyright, professional judgment, cultural interpretation, affected-party legitimacy, Māori wording, tikanga, tangata whenua, iwi, hapū, Māori data governance, and Māori authority remain with competent and affected people and authorities.

The four learning lenses are digital provenance and archival description, simulation test design, requirements engineering, and accessible information architecture. They are study lenses, not qualifications. The recommended Ilyan lenses are adversarial media-provenance analysis and bounded Unreal simulation quality assurance.

At repository seal the next edge is still PREPARED_NOT_SENT. Only after the fourth commit is pushed, clean, 0/0 divergent, fresh-four-way equal, within the file and commit ceilings, and accepted by one exact-final owner-scoped canonical may Vesper freshly resolve the unique existing exact-title task `Ilyan Reed`, immediately reread duplicate/pause/redirect/privacy/usage/safety guards, and send one compact activation for v689-v8. A failed or unavailable route remains unsent; no replacement, standby, UI automation, guessed identifier, or resend is permitted. The terminal verdict remains NOT_READY_FOR_STAGE_20.
