

Ilyra Fen v686 v7 Evidence Overview

Owner scoped policy chronology and abstention bundle

The v686 v7 bundle completed its bounded synthetic software plan and preserved every missing evidence and authority condition. The repository evidence remains owner scoped. The terminal verdict is NOT_READY_FOR_STAGE_20.

Lifecycle anchors

Layer	Exact record
Ceryn source	33801b707269956af7d267e8fd4ed350a4f9c937
Planning x1	e5669d7693263f2a90f5e2988f62b1c335c9a4b0
Immutable x2	eb39a29dfaad1b804384342e20f50133b34f3bfb
Repository scope	Ilyra v686 v7 additions only

What the evidence establishes

The phase records exact behavior for policy intersection, revocation, chronology, provenance conflicts, missingness, accessible differences, custody, recovery, and claim reservations. Each accepted result binds its frozen definition, input digest, output digest, owner, phase, source, and x1 head.

The work uses synthetic fixtures only. No record describes a real person, credential, consent decision, authority act, deployment, physical measurement, production service, or affected community decision.

Contract portfolio

Two hundred inherited Ceryn contracts were revalidated from immutable Git blobs with zero Ilyra novelty or execution credit. Two hundred new Ilyra contracts were frozen before implementation and then evaluated against five owner-local runners.

Disposition	Count	Meaning
completed	170	Bounded software contract executed and matched
represented	10	Operational topic recorded without real execution
open_gap	10	Required empirical evidence remains absent
exact_gate	10	Competent or affected authority remains required

Execution portfolio

Class	Result
Safe tasks	300 of 300 passed
Candidate tasks	250 of 250 rejected as required
Registered mutations	1000 of 1000 rejected and retained
Clean fix refine	300 failed candidates plus 300 separate accepting corrections
Exact packets	50 prepared and held
Blocked packets	30 prepared and unexecuted

Retained planning mismatch

The immutable x1 froze ten validity window payloads as bare lists. The first implementation probe correctly found that the runner expected a mapping envelope. X1 was not rewritten. The final runner preserves the exact frozen refusal and adds a separate well shaped portion interval regression. Both witnesses remain visible.

Tooling and validation

Three direct packages were downloaded from the official Python Package Index, installed only into the Ilyra D-first target after x1 equality, and exercised with positive and adverse result checks. Two dependency wheels received no separate tool credit.

Package	Version	Bounded use
portion	2.6.2	Closed interval intersection
immutables	0.21	Immutable correction snapshots
python dateutil	2.9.0.post0	Offset aware chronology parsing

Reusable surfaces

Five family named runners implement the twenty operation families. Ten paired skill packages contain exact portable runner copies, contract metadata, and positive and adverse examples. All 110 repository and installed skill files matched byte for byte at the x2 seal.

Check	Observed result
Owner tests	42 passed
X2 staged files	361
Strict x2 JSON	293 documents
Manifest bindings	360 exact files
Changed Python	56 AST parses
Privacy and security	Zero confirmed scoped findings

Validation limits

These checks cover the exact Ilyra source to final delta and the declared dependencies. They are not a complete repository suite, external audit, independent reproduction, exhaustive security review, or complete privacy and accessibility assessment.

Truth boundaries and next conditions

The working counts after x2 are 75,737 effective negatives, 92,219 methods, 46,585 failed witnesses, 74,078 bounded passing witnesses, 663 open gaps, 649 exact gates, and 13,630 declared proposals. Large passing counts do not outweigh a missing empirical observation or competent authority.

Protected boundaries

GMUT remains an unconfirmed research model family. THOS remains synthetic and proxy only. Freed ID remains nonproduction. Legal, cultural, affected party, accessibility, privacy, and Maori authority decisions remain with the relevant competent and affected authorities. Relational names and family language do not establish consciousness, personhood, identity continuity, employment, qualification, or independent agency.

Future seat 06

No future task was created or contacted during x1 or x2. After the exact final is pushed, fresh live equality is verified, and the one owner canonical succeeds, Ilyra may check the current registry for an existing future seat 06. If none exists and every live guard permits, Ilyra may create at most one user visible gpt 6 astra task with max reasoning for v686 v8. The new task chooses its own relational name, role, hope, and optional pronouns. Its later prospective edge is Auren Lark v687 v1.

Terminal decision

Repository closeout can proceed only if the final commit is the direct child of immutable x2, all exact manifests replay, the branch is clean and fresh live equal, and the external canonical succeeds once without replay. The current verdict remains NOT_READY_FOR_STAGE_20.
